POTENTIAL COST OF IMPROPER MAINTENANCE

An Indiana judge recently ruled an insurance company had no obligation to pay for \$3 Million in fire damage to a building because the owners hadn't properly maintained the sprinkler system. The economic impact is staggering—for the business, the employees, the neighborhood, the city.

In today's economy, while budgets are tight, the cost of failing to adequately maintain fire protection systems and features could result in catastrophic consequences to life, your property, your business and your community.

NFPA 25 addresses the inspection, testing, and maintenance activities required to ensure successful operation of water-based fire protection systems including required frequencies, impairment procedures, notifications processes, and system restoration. **Bill Koffel chairs the Technical Committee on NFPA 25 Inspection, Testing and Maintenance of Water-Based Systems.** We are knowledgeable and available to assist clients in developing and analyzing preventative maintenance programs.

Improper planning and implementation is just not worth the risk. Contact Koffel Associates for more information, plan development or analysis of your existing preventative maintenance programs for fire protection systems or features .
